Commodity Data Platform

Can heterogeneous commodity observations be made traceable, comparable and reproducible?

Versioned research data platform | 5 November 2026

THE RESULT The 7 October 2026 local snapshot records 224,844 source observations and 37,747 derived observations across 14 derived series. These are coverage counts, not a common aligned investable universe. The local suite contains 36 tests.

APPROACH

Source adapters archive inputs and retrieval hashes, validate units and structure, preserve retrieval vintages, and publish DuckDB/Parquet queries and a searchable catalogue. Derived series retain input lineage; contract roll accounting is distinct from spot and rank proxies.

SCOPE & LIMITATIONS

One dated WTI contract close does not validate real roll transitions or official settlements. USDA history is partial and imported manually. Hosted recovery, off-device durability and exchange-session validation need their own evidence. The latest reviewed hosted ingestion job failed during source refresh; the local test suite is not proof of daily operation.

EXPLORE

Follow the README quick start and open the generated catalogue. Inspect docs/COMPLETION.md before discussing operational status; run the existing local test suite.
